Flex strip curtain

03/2007

The brake is screwed to the switch part of the roller-bearing alu-profile rail. At the eye of the brake the pulling rope is tied. In front of the screwing of the switching rail with the structure, the alu-profile rail is run into the switching profile. The switching rail is screwed to the ceiling using the ceiling sleeves.

The PVC strips are manufactured with a negative measurement of 20mm. After a few days in heated chambers the strips elongate. After a longer period of time, the PVC strips can have elongated so far, that they stand up on the ground. The strips can be cut simply by using the blade provided.

To suspend the PVC strips, the clip is set with an angle of approx. 40° to the profile rail and clipped on to the rail using a plastic hammer.

The suspension of the PVC strips occurs by cancelling the single clip from the alu-profile rail with an angle of approx. 30°

Strip type
200mm wide x 2mm thick, length mm

Part total number of strips

Of which concave parts with a red point

Strip type
300mm wide x 3mm thick, length mm

Part total number of strips

Of which concave parts with a red point

Strip type
400mm wide x 4mm thick, length mm

Part total number of strips

Of which concave parts with a red point

Firstly suspend all concave strips beginning on the left (with red point) in the profile rail.
Afterwards hang the covering strips according to overlap over the concave strips (convex).

at places with the gap is with an empty clip closed
